

Home and work, with space between

Ground floor | A two-storey main house and a single-storey office / gym pavilion linked across a garden gap

The organising idea

All bedrooms belong to the main house.
The office sits in its own low pavilion,
across an open garden gap.

A short enclosed passage gives an indoor
route from arrival hall to office. It avoids
the bedroom stairs and main living room.

Office and gym have separate lobby doors.
Storage and circulation sit between them.

Ground-floor programme retained

Generous shared kitchen / dining / living.
Guest bedroom with a nearby shower.
Reading / play snug and small orangery.
Pantry, separate laundry, boot room and WC.
Dedicated office and indoor-connected gym.
Two covered household bays plus a guest bay.

What changes from the U

An offset pair of buildings creates a garden
pocket instead of the original formal U.
The orangery opens from shared living;
it is separate from the work passage.

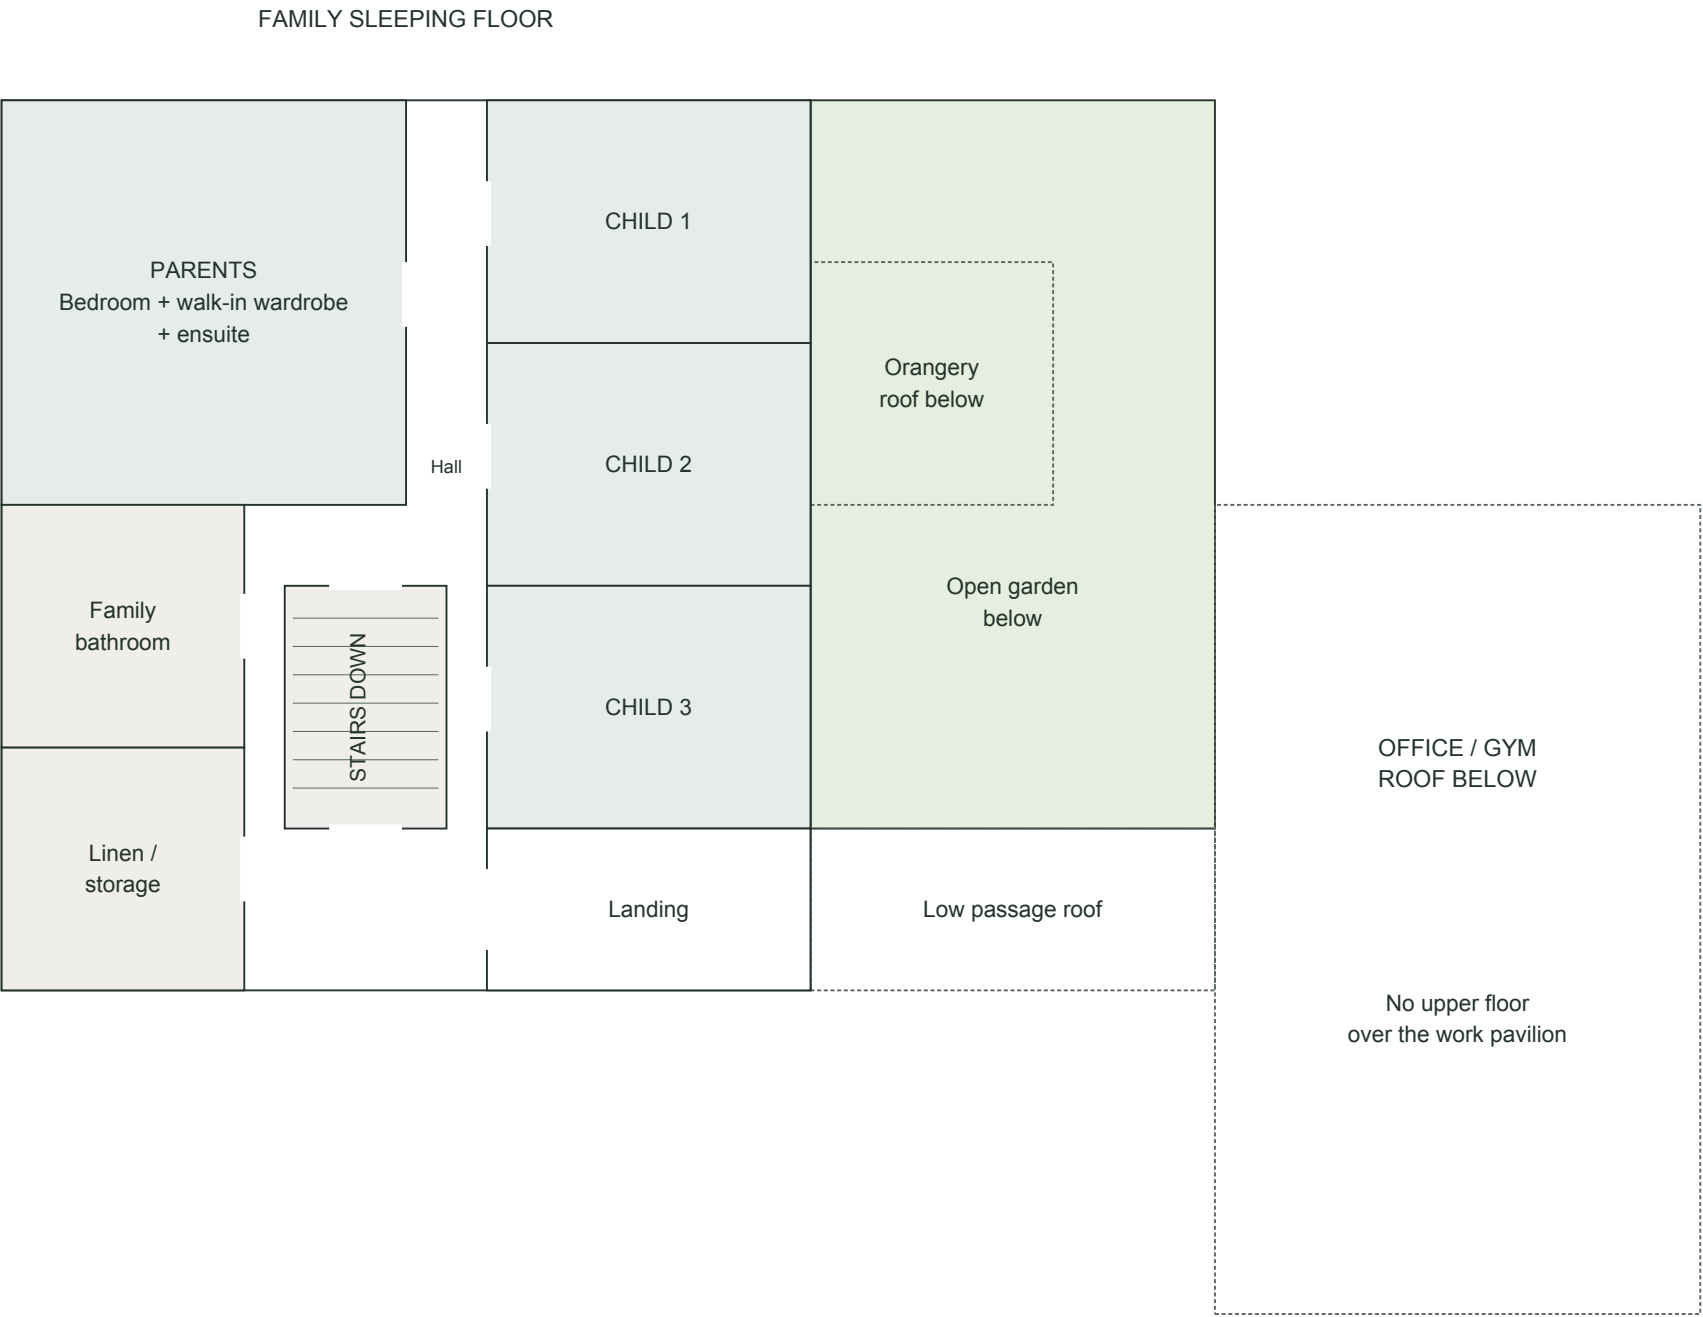

The passage adds circulation and external
wall area. Footprint savings are not assumed.

..... Route from arrival to office

Openings show intended connections. Service rooms and stairs are reserved
as groups; their detailed subdivisions and clearances are not yet fitted.

Family upstairs; work stays apart

Upper floor | Bedrooms occupy the main house only | Same diagram coordinates and stair position as the ground floor

Separation in three dimensions

Parents and all three children share a floor.
The family bathroom serves the children;
parents retain their own ensuite and wardrobe.

The ground-floor guest room also stays in
the main house, away from the work pavilion.
No bedroom shares a wall or floor with
the office or gym.

Architectural direction

A taller family house with a low work wing
and a light garden passage between them.
Warm timber, pale masonry and planting
could give the two forms a shared character.

Roof form and window orientation remain open.
Direct office views towards the side garden
could help privacy from upstairs bedrooms.

Next design checks

Fit the full room schedule and an actual stair.
Test landings, access and furniture clearance.
Resolve acoustic separation and gym vibration.
Coordinate structural and service routes.
Test sunlight, privacy and roof drainage on a site.
Then compare total area and footprint with
the single-storey concept 05.

Dashed outlines are lower roofs, not upper rooms or roof terraces.
This is a separate design option. The single-storey concept 05 remains
the measured baseline; its geometry checks do not apply to this diagram.
